

Hamad Samir Hamad Tarawa

Software Engineering Student | Full-Stack Developer | Spring Boot & React | Cloud/DevOps Enthusiast

Palestine | tourt2031@gmail.com | [GitHub: hamooda12](https://github.com/hamooda12)

PROFILE

Software Engineering student with hands-on experience building full-stack applications, REST APIs, microservices, authentication/authorization flows, Dockerized deployments, and AWS-based CI/CD. Strong academic foundation in programming, object-oriented design, data structures, software construction, databases, web technologies, and system design. Seeking a software engineering internship to contribute to real production systems while growing in backend, cloud, and system architecture.

TECHNICAL SKILLS

Backend	Java, Spring Boot, Spring Data JPA, REST APIs, Spring Security, JWT, roles & permissions, PHP
Frontend	React, Vite, JavaScript, HTML, CSS, React Router, components, useState, useEffect, token refresh flows
Databases	MySQL, AWS RDS, database design, CRUD operations, schema/table management
Microservices & Architecture	Monolith-to-microservices migration, Eureka Server, API Gateway, RestClient, service-to-service communication, system architecture
Cloud & DevOps	AWS ECS, AWS Load Balancer, Docker, Docker Compose, GitHub Actions CI/CD for test/build/deploy
Core CS & SE	OOP, design patterns, data structures & algorithms, software construction, requirements engineering, UX/UI basics
Tools	Git, GitHub, Swagger/OpenAPI, Postman, Maven, Linux/CLI basics

SELECTED PROJECTS

Tourism/Hotel Booking System - Microservices Migration | [GitHub](#)

Tech: Spring Boot, Spring Security, Spring Data JPA, MySQL/RDS, Docker, Docker Compose, Eureka, API Gateway, RestClient, AWS ECS/ALB, GitHub Actions

- Migrated a hotel management system from a monolithic architecture into microservices while preserving business behavior and service boundaries.
- Implemented service discovery with Eureka, API routing through an API Gateway, and synchronous inter-service communication using RestClient.
- Configured JWT-based security with roles and permissions across services, plus CI/CD pipelines for testing, building, and deployment to AWS ECS behind an Application Load Balancer.
- Dockerized services and database setup using Dockerfiles and Docker Compose; integrated MySQL with AWS RDS for cloud deployment.

Tourism/Hotel Booking System - Monolithic Version | [GitHub](#)

Tech: Spring Boot, Spring Data JPA, Spring Security, REST APIs, MySQL

- Built the original monolithic version of the hotel management system with authentication, authorization, catalog, booking, and management functionality.
- Used as the base for later microservices decomposition, highlighting understanding of both monolithic and distributed architectures.

Hotel Management Frontend | [GitHub](#)

Tech: React, Vite, JavaScript, CSS, Docker, GitHub Actions

- Developed the React frontend for the hotel management system using reusable components, routing, state management, refresh-token handling, and API integration.
- Repository includes Vite project structure, Dockerfile, workflows folder, and frontend source structure.

Generic CRUD Dashboard System | [GitHub](#)

Tech: PHP, JavaScript, CSS, HTML, MySQL

- Created a lightweight dashboard that connects to a chosen database using host, username, password, and database name, then enables CRUD operations for tables.
- Planned refactor: migrate the project into React frontend and Spring Boot backend for a cleaner modern full-stack architecture.

Quran Reader Website | [GitHub](#)

Tech: React, JavaScript, CSS, HTML

- Built a Quran audio website allowing users to choose reciter and surah, search surahs, paginate results, and play recitations.
- Refactored the project from Vanilla JavaScript into a React-based implementation and deployed it as a frontend project.

Hotel Project Refactoring with Design Patterns | [GitHub](#)

Tech: Java, Spring Boot, Docker, Design Patterns

- Refactored a hotel-related project using common design patterns including Abstract Factory, Factory, Strategy, Singleton, and Builder.
- Focused on cleaner object-oriented structure, maintainability, extensibility, and separation of responsibilities.

EDUCATION

Bethlehem University - B.Sc. Software Engineering

2023 - Present | Cumulative earned credits: 83 | Honors received in Fall 2025

Relevant coursework: Introduction to Programming, Object-Oriented Programming, Data Structures & Algorithms Analysis, Advanced OOP, Software Construction, Database Management Systems, Web Technologies, Computer Networks, Operating Systems, Software Requirements Engineering, UX & Interaction Design, Discrete Mathematics, Probability.

ACADEMIC HIGHLIGHTS

- Strong grades in core programming and software engineering courses: Introduction to Programming, Object-Oriented Programming, Data Structures & Algorithms Analysis, Probability, and Software Construction.
- Completed coursework covering backend development, databases, web technologies, networking, operating systems, requirements engineering, UX/UI, and advanced object-oriented programming.
- Recognized with Honors for Fall 2025 academic performance.

STRENGTHS

- Quick learner who can move between backend, frontend, cloud deployment, and architecture tasks.
- Comfortable debugging real integration issues involving JWT security, Swagger/Postman behavior, Docker networking, databases, and service-to-service communication.
- Able to explain technical decisions clearly and collaborate in team-based university projects.
